

Why Infrared Heat?

Infrared heaters work the same way that the sun does. Infrared rays heat the object directly, not the air around it. When the object becomes hot, it heats the surrounding air and any other objects. With infrared heat, people, machinery, objects and floors all become heat reservoirs -- leading to greater fuel and cost efficiency. It's the perfect heating solution to large buildings like warehouses, machine and auto body shops, terminals, manufacturing plants and farm buildings.

Warm Air Convection Heating

Forced warm air units heat from ceiling down. Wasted layers of heat stay at ceiling level, leaving floors cold, draft, and uncomfortable.

Infrared Gas Heating

Enerco infrared heaters direct line-of-site radiant heat to floor-level objects, which in turn, heat surrounding air to the desired temperature. Personnel and objects at floor level enjoy instant, cost-saving comfort.
